Green Software for Paperless Manufacturing

Cincinnati, OH (10/01/2008): CIMx has released their latest paperless manufacturing software upgrade, Interax[®] v6.2. Interax v6.2 provides customers with major new features which include, Multiple Piece Data Collection (MPDC) and automated Labor Tracking. MPDC allows users to replace error prone paper 'check sheets' with an electronic table automatically created by the software. Automated Labor Tracking eliminates the need for users to manually record labor time.

CIMx has upgraded the way customers receive this sophisticated product suite which is an electronic shop floor foreman that manages shop floor operations. As of Interax v6.2, all product releases will be available through website download. By allowing customers to receive all materials via the Internet, CIMx actively participates in the global need to conserve resources as much as possible.

“This is an exciting time for CIMx. We have just past our 12th anniversary and are still growing and evolving. By delivering our product via the Internet, we are actively promoting a paperless environment for the customer, which is our main objective,” states Kristin McLane, President.

About CIMx – The CIMx software solution creates a paperless manufacturing environment. CIMx software streamlines manufacturing operations by removing the source of errors and lost productivity across the shop floor. In a time of increasing global competition, U.S. manufacturers gain an edge that helps keep work right here. Throughout our history, the CIMx philosophy remains constant – make it affordable, make the implementation seamless and make the support capabilities as efficient as possible. CIMx is a woman-owned business and has been in operation for 12 years.
